Spawner (Jul-Sep Catch) Covariates Analysis

Table 1: Table B1. Model selection tests of GPCP precipitation as an explanatory variable for the catch during spawning months (Jul-Sep) using 1983 to 2015 data. The data range is determined by the years for which SST was available in order to use a consistent dataset across covariate tests. S_t is the catch during Jul-Sep of season t. V_t is the covariate in the current season which spans two calendar years from July to June in the next year. V_{t-1} is the covariate in the prior Jul-Jun season.

Table 2: Table B2. Model selection tests of average sea surface temperature off the Kerala coast (up to 160km offshore) in different months off Cochi as the explanatory variable (V_t) for the catch during spawning months (Jul-Sep) using 1983 to 2015 data. The hypothesis tested (Table 1) is noted in parentheses. See TableB1for an explanation of the models.
